

## ABSTRACT OF THE DISCLOSURE

Images of a predetermined location such as a construction site can be obtained easily. Photography instruction information including sketches of spots to be photographed, the names of the spots, and a process number is sent from an image management apparatus to a digital camera for photography of the images necessary for process management regarding the site. The digital camera sequentially displays the sketches and the names of the spots included in the photography instruction information on a monitor, and photographs the spots according to the sketches and the names. Image data sets obtained by photography are sent to the image management apparatus via a wireless LAN. The image management apparatus manages the site based on the image data sets sent from the digital camera.
